

The Costs of Cycling Infrastructure

European Cyclists' Federation

Aleksander Buczyński, Policy Officer – Infrastructure, a.buczynski@ecf.com

30 March 2021

ECF gratefully acknowledges financial support from both the LIFE Programme of the European Union and the cycling industry via Cycling Industries Europe. The information and views set out in this report are those of the author(s) and do not necessarily reflect the official opinion of the European Union nor Cycling Industries Europe. Neither the European Union institutions and bodies, Cycling Industries Europe, nor any person acting on their behalf may be held responsible for the use which may be made of the information contained therein.

The costs of constructing cycling infrastructure vary from under €50,000 to over €10,000,000 per kilometre. While cycle tracks per se are very cheap, most costs are determined by the range of additional works included in the project. This factsheet presents the "typical" unit costs for a few different scenarios, key factors influencing the costs of cycling projects and concrete examples of cycling infrastructure projects in various European countries, either implemented in the past few years or planned for the near future.

Contents

| 1. | Typical costs per category | . 2 |
|----|--|-----|
| | | |
| 2. | Key factors influencing cost of delivery | . 4 |
| | | |
| 3 | Case studies | 7 |

1. Typical costs per category

| euro/km | |
|------------|--|
| 50,000 | Simple cycle track in easy terrain outside built-up area, no significant challenges |
| 200,000 | Mixed localisations and solutions, some challenges to overcome |
| 500,000 | Urban area, or difficult terrain, or cycle highway standard ¹ in easy terrain |
| 1,500,000 | Cycle highway standard in urban area |
| 10,000,000 | Cycle bridge over a major river or other obstacles, elevated track |

Figure 1. In greenfield conditions, a high-quality cycle track can be built for €50,000 per km. Photo credit: VeloMałopolska.

¹ The quality requirements for cycle highways differ across regions, but generally cycle highways are wider and more often use bridges or tunnels to cross major roads. See: https://cyclehighways.eu/design-and-build/design-principles.html

Figure 2. RAVeL 38, part of EuroVelo 3 in Wallonia on a disused railway, cost around €200,000 per km, including a separate "soft" lane for horse riders and repairs to engineering structures.

Figure 3. Cycle highways in the Dutch province of Gelderland are usually 4 m wide, cross major roads by tunnels and bridges, and cost between €300,000 and €1,800,000 per km.

Figure 4. Warsaw, Poland, has recently implemented 71.5 km of cycle paths with an average cost of €600,000 per km, including three bridges, renovation of 43 km of sidewalks and 70 traffic lights.

2. Key factors influencing cost of delivery

| Localisation | Impact |
|--|---|
| Built-up area | High chance of necessary additional works, e.g. reconstructing drainage, electricity, gas pipes, traffic lights. Necessitates using kerbs, sometimes moving the edge of the carriageway or rearranging public transport stops. Most of these works are more expensive than the track itself. In densely built urban centres, introducing high-quality cycling infrastructure might require a complete road reconstruction. Land acquisition is also more expensive in built-up areas. |
| Protected heritage or environmentally sensitive area | Might require special, more expensive materials, solutions, limit the construction period and/or the selection of contractors. |

| Organisational factors | Impact |
|--|---|
| Co-operation of key infrastructure owners and administrators | Construction of a cycle track might require resolving conflicts with other road administrations, railways, owners of underground infrastructure (electrical grid, water, sewage). The administrator of the conflicting infrastructure might require the investor of the cycle track to include and pay for additional works as a condition of agreement (e.g. renovating the underground infrastructures before putting a new surface). |
| Legal tools for land acquisition | Being unable to acquire land for the optimal itinerary might lead to not only lower quality, but also increase of costs. For example, placing cycle track in narrow strip available along a road, instead of across the fields 50 m further away, might necessitate construction of drainage, adding barriers, expensive reconstructions. |
| Scale of works & standardisation | Short sections or diversification of technical solutions do not allow "economy of scale". Especially important in beginning countries and regions where, for example, the contractors may need to acquire new (narrower) machines to lay out cycle tracks. |

| Technical elements | Impact |
|--------------------|--|
| Bridges & tunnels | Cycle track on a bridge can be 100 times more expensive per running metre than on the ground. Costs can be significantly reduced with advance planning and integrating cycle bridges and tunnels in other engineering solutions, without the need to add them separately as stand-alone projects. However, a strategically located cycle bridge can reduce the need for dedicated infrastructure on much longer section (for example by connecting existing local roads with low traffic). |
| Drainage | (Re)construction of drainage can be five times more expensive than construction of the cycle track itself. It can also be a factor in rural areas (especially if no tools for land acquisition exist and the cycle track is placed just next to the carriageway) and on disused railways (section in trenches). |
| Traffic lights | Installing or modernising traffic lights on a junction can costs as much as 5-10 km of greenfield cycle track. Several cycling projects significantly reduced the costs by removing the need for traffic lights (for example by reducing the number of car lanes and introducing traffic-calming elements). |
| Barriers | Different types of barriers protect cyclists from falling from a slope or bridge, but also from getting hit by a car running off the road, if the cycle track is not distanced from the carriageway. If you need to put barriers along the cycle track, it will probably cost more that the track itself (how much, it depends on the required level of protection from impact). |

| Technical elements | Impact |
|-----------------------|---|
| Non-standard surfaces | Non-standard surfaces might require expensive manual labour (for example paving blocks), limit the selection of contractors or incur additional costs (for example by necessitating the addition of kerbs). |
| Kerbs | Kerbs increase the costs of surface construction by ~30%. |

The above lists present selected elements that are specific for or make a big difference for cycling projects, but it is by no means exhaustive. Other more general factors, such as a supply/demand balance on the construction market, distance from the source of construction materials or soil type, can also affect the costs of specific projects.

The following publications provide further overviews of costs on the national level:

- Typical Costs of Cycling Interventions Interim analysis of Cycle City Ambition schemes (UK, 2017):

- Kosten von Radschnellwegen (Germany, cycle highways only, 2019): https://www.forschungsinformationssystem.de/servlet/is/499514/?clsId0=276639&clsId1=276644&clsId2=2768628clsId3=0

3. Case studies

| | Cost/km | Country | Description | Year | Length [km] | Total cost | Factors affecting cost |
|----|---------|-------------------------------|--|---------------|----------------|------------|--|
| | | | | | | [euro] | |
| 1 | 45,000 | Poland | 1st stage of VeloMałopolska regional network | 2015- 2016 | 190 | 8.6 M | Asphalt surface, 2.5 m wide, mostly on levees, includes a 160 m long cycle bridge. Implemented by the regional road administration. |
| 2 | 54,500 | France | Voie Bleue, section Tournus – Ouroux-sur- Saône | 2020 | 22 | 1.2 M | Towpath along Saône: stabilised gravel, 3-3.5 m wide. |
| 3 | 108,000 | Italy | Ciclovia del Sole (EuroVelo 7), section Mirandola – Osteria Nuova | 2019- 2021 | 46 | 5 M | On disused railway Bologna – Verona, some barriers and bridges |
| 4 | 130,000 | Poland | Varied sections in Pomerania region | 2019 | 114 | 14.9 M | Varying standard and localities, ~60% asphalted, implemented by different municipalities. |
| 5 | 141,000 | Belgium | RAVeL 156 Aublain – Mariembourg | 2020 | 8.5 | 1.2 M | 2.7 m asphalt, on disused railway. |
| 6 | 150,000 | Poland | Green Velo | 2015 | 450 | 69 M | Includes 300 km dedicated cycle tracks, 150 km modernised gravel roads, 30 bridges and 2000 km of signage. |
| 7 | 197,000 | Belgium | RAVeL 138 Melen – Plombieres | 2017- 2020 | 23 | 4.5 M | 2.5 m asphalt + 2 m stabilised shoulder for horse riders and joggers, on disused railway. |
| 8 | 280,000 | Nether- lands / Germany | Europa-Radbahn cross- border cycle highway | 2019 | 23 | 6.5 M | Traffic lights with sensors prioritising cyclists, e-bike charging stations. |
| 9 | 400,000 | Denmark | Greater Copenhagen supercyclehighway network | n/a | 746 | 295 M | Estimated costs of the whole system. |
| 10 | 480,000 | Spain | EuroVelo 8 San Fernando - Chiclana | 2022 | 5.4 | 2.6 M | Protected area in the Bay of Cádiz, includes 4 bridges (longest: 200 m). |
| 11 | 600,000 | Poland | 20 sections of cycle tracks in Warsaw | 2016- 2019 | 71.5 | 43 M | 3 new bridges (longest: 600 m), retrofitting 1 interchange (tunnel + bridge), 43 km of sidewalks, new or modernised traffic lights on 70 intersections, 100 renovated public transport stops, 650 lanterns, 870 trees, 84500 bushes. |

| | Cost/km | Country | Description | Year | Length [km] | Total cost [euro] | Factors affecting cost |
|----|------------|------------------|--|---------------|----------------|-------------------------|---|
| 12 | 780,000 | Nether- lands | 9 cycle highways in the province of Gelderland | 2016- 2022 | 108 | 84 M | Usually 3.5-4 m wide, coloured asphalt. Includes bridges & tunnels, but also some pre-existing sections. |
| 13 | 1,500,000 | Germany | Cross-comparison of cycle highway studies for Hamburg, Ruhr area, Berlin, Saxony and Baden-Württemberg | n/a | | | Estimates from studies vary from 220,000 to 2,000,000 euro/km, including reconstruction of junctions and engineering structures; one of the studies points out that the actual road construction constitutes only 20% of the total costs. |
| 14 | 12,000,000 | Belgium | F3 cycle highway, section Zaventem – Diegem | 2020- 2021 | 2 | 24 M | Elevated cycle track, with 4 bridges, 1 tunnel and multiple connecting ramps. |
